

■ FurryOS Gen2.1

Build Guide & Mode Switcher

Welcome to FurryOS Gen2.1! This guide will help you understand the folder structure, build your own custom OS from source, and switch between different modes. FurryOS is designed to be flexible, secure, and fun—with five distinct modes tailored to different user needs.

■ Folder Structure

Before building, you need to organize your assets in the correct folders. FurryOS expects a specific directory structure. Here's what your ~/FurryOS folder should look like:

Folder Path	Purpose	File(s)
sourcecode/	Your build scripts & source	GENOME.yaml, build scripts
sourcecode/payload/assets/wallpapers/	Desktop background images	default.jpg (1920×1080+)
sourcecode/payload/assets/splash/	Boot splash screen	splash.png (1024×768)
sourcecode/payload/assets/sounds/startup/	Log in/startup sound	startup.ogg
sourcecode/payload/assets/sounds/shutdown/	Shutdown sound (optional)	shutdown.ogg

■ Asset Naming Details

default.jpg: Your main desktop wallpaper. Recommended: 1920×1080 or higher. Must be JPEG format.

splash.png: Boot screen image shown while FurryOS loads. Recommended: 1024×768 PNG with transparency.

startup.ogg: Sound played when user logs in. OGG Vorbis format (compressed, best quality/size ratio).

shutdown.ogg: Sound played during shutdown. Optional. OGG format.

■ Step-by-Step Build Guide

Step 1: Prepare Your Assets

Create the folder structure in your home directory and add your custom assets. For example:

```
mkdir -p
~/FurryOS/sourcecode/payload/assets/{wallpapers,splash,sounds/{startup,shutdown}}
cp my_wallpaper.jpg ~/FurryOS/sourcecode/payload/assets/wallpapers/default.jpg cp
my_splash.png ~/FurryOS/sourcecode/payload/assets/splash/splash.png cp
my_startup_sound.ogg ~/FurryOS/sourcecode/payload/assets/sounds/startup/startup.ogg
cp my_shutdown_sound.ogg
~/FurryOS/sourcecode/payload/assets/sounds/shutdown/shutdown.ogg
```

Step 2: Copy Your Build Scripts

Place your GENOME.yaml, build scripts, and optional GUI into ~/FurryOS/sourcecode/:

```
cp GENOME_Gen2.1_Final.yaml ~/FurryOS/sourcecode/ cp
build_furryos_gen2.1_enhanced.sh ~/FurryOS/sourcecode/ cp
FurryOS_Live_Multimedia_Setup_Post_ISO_Gen2.1.sh ~/FurryOS/sourcecode/ cp
FurryOS_Gen2.1_Builder_GUI.py ~/FurryOS/sourcecode/ chmod +x
~/FurryOS/sourcecode/*.sh chmod +x ~/FurryOS/sourcecode/*.py
```

Step 3: Open the Source Folder (Optional)

To browse and edit your assets before building, open the sourcecode folder in your file manager. On the desktop, you'll find a shortcut icon labeled "FurryOS Source" that opens ~/FurryOS/sourcecode/ directly.

Step 4: Build Your Custom ISO

You have two options to build your custom FurryOS ISO:

Option A: Command-Line (Advanced)

```
cd ~/FurryOS/sourcecode sudo ./build_furryos_gen2.1_enhanced.sh # Build takes 15-30
minutes # ISO location: _generated/output/furryos-gen2.1-final-amd64.iso
```

Option B: GUI (Easy)

```
cd ~/FurryOS/sourcecode python3 FurryOS_Gen2.1_Builder_GUI.py # Window opens with
build options # Click "Build" to start
```

Step 5: Test Your ISO (Optional)

Before burning to USB, test your ISO in a virtual machine:

```
qemu-system-x86_64 -cdrom  
~/FurryOS/sourcecode/_generated/output/furryos-gen2.1-final-amd64.iso -m 2G -smp 2
```

Step 6: Create Bootable USB

Once satisfied with your custom ISO, write it to a USB stick:

```
lsblk # Identify your USB device (usually /dev/sdX) sudo dd  
if=~/FurryOS/sourcecode/_generated/output/furryos-gen2.1-final-amd64.iso  
of=/dev/sdX bs=4M status=progress && sync
```

■ Switching Between Modes

FurryOS includes five distinct modes optimized for different users. You can switch between modes at any time, and all your files and preferences will be preserved.

■ Granny Mode

Simple interface with large fonts, high contrast, and easy controls. Perfect for accessibility.

■ Normal Mode

Balanced mode with office suite, email, media players, and basic utilities.

■ Gamer Mode

Optimized for gaming with Steam, Lutris, Wine, and performance monitoring tools.

■■■ Hacker Mode

Full development environment with VS Code, Python, Node.js, Docker, and security tools.

■■ Ghost Mode

Privacy-focused with encryption, Tor, VPN tools, and anonymity features.

How to Switch Modes

There are multiple ways to switch between modes:

Method 1: Desktop Shortcut (Easiest)

Look for the "FurryOS Mode Switcher" icon on your desktop. Double-click it to open a window where you can select your desired mode. Click "Apply" and the system will update your theme, fonts, software, and security settings.

Method 2: Settings Menu

Go to Settings → FurryOS Mode Switcher (same as desktop shortcut).

Method 3: Command Line (Advanced)

```
furrysos-mode-switch granny # Switch to Granny Mode furrysos-mode-switch normal #  
Switch to Normal Mode furrysos-mode-switch gamer # Switch to Gamer Mode  
furrysos-mode-switch hacker # Switch to Hacker Mode furrysos-mode-switch ghost #  
Switch to Ghost Mode
```

■ Desktop Shortcuts & Icons

When you boot FurryOS, you'll see several desktop icons for quick access:

FurryOS Mode Switcher: Switch between Granny, Normal, Gamer, Hacker, and Ghost modes.

FurryOS Source Folder: Opens ~/FurryOS/sourcecode/ in file manager to manage assets and rebuild.

FurryOS Documentation: This README file with build instructions and mode information.

Install Custom Packages: Opens package manager to install additional software.

■ Installing Custom Packages

FurryOS is based on Debian/Ubuntu, so you can install any Debian package. Choose your preferred method:

Method 1: GUI Package Manager (Easiest)

Click "Install Custom Packages" on your desktop. Search and install with no technical knowledge required.

Method 2: Software Center (Graphical)

Open GNOME Software or Synaptic from your applications menu.

Method 3: Terminal (Advanced)

```
sudo apt update # Update package lists
sudo apt install package-name # Install a package
sudo apt search keyword # Search for packages
sudo apt remove package-name # Uninstall a package
```

■ Security & Encryption

FurryOS supports LUKS2 full-disk encryption to protect your data, available in **all modes including Granny Mode**. During setup, you'll be offered the option to encrypt your hard drive with a password, protecting your files with military-grade AES-256-XTS encryption.

- AES-256-XTS encryption (military-grade)
- TPM 2.0 auto-unlock support (optional)
- YubiKey/FIDO2 hardware key support

- Recovery codes for password reset
- Available in all modes, simplified in Granny Mode

■ Telemetry & Privacy

By default, FurryOS collects **zero telemetry data**. Your privacy is respected. Optionally, you can share anonymous crash reports to help improve FurryOS. Change your privacy settings anytime in Settings → Privacy.

- Default: Zero telemetry (maximum privacy)
- Optional minimal crash reports only
- Websites visited are NEVER tracked
- Search queries are NEVER logged
- Files are NEVER scanned or uploaded

■ Troubleshooting

Q: Build fails with permission error

A: Run with sudo: `sudo ./build_furryos_gen2.1_enhanced.sh`

Q: Assets not appearing on boot

A: Check file names match: default.jpg, splash.png, startup.ogg

Q: Desktop icons missing

A: Right-click desktop → Show Icons

Q: Mode switcher not working

A: Try: `furryos-mode-switch`

Q: Can't open Source folder

A: Click 'FurryOS Source' icon or manually open `~/FurryOS/sourcecode`
